

What is KAN™-7? For Seed Treatment

- ✓ KAN-7 is a amino acid complex containing chelated iron. KAN-7 is optimized for promoting root growth and vigor, resulting in better crop establishment.
- ✓ As a seed treatment or in-furrow application, KAN-7 aids in more uniform emergence.

How is it unique?

- ✓ The combination of the amino acid complex and the chelated iron make KAN-7 unique. KAN-7 is compatible with all types of seed treatments, whether it be pesticidal, microbial, or a combination. KAN-7 is a liquid amino acid product that was initially developed as a seed treatment, but we have found that it can also be applied in-furrow and as a foliar spray with added contribution to yield.
